

ResolGate: An AI-Assisted Approval-Based Knowledge Repository

ABSTRACT

ResolGate is a secure file management system that provides controlled file sharing with an admin approval workflow. Users can upload files and folders, which remain pending until approved. The platform integrates AI-based content moderation to detect harmful or inappropriate content. Built with React and a cloud backend, it ensures secure storage, real-time updates, and responsive access.

DESCRIPTION

ResolGate allows users to upload files and folders while preserving directory structure. All uploads enter a pending state and require admin approval before becoming visible. Users can create, rename, move, delete, and preview files. The system supports drag-and-drop uploads, favorites, recent file tracking, and shareable links with expiry dates and download limits.

Administrators manage uploads through a dashboard where they can approve or reject files individually or in bulk. AI moderation scans content and assigns safety levels (Safe, Low, Medium, High Risk) to assist decision-making.

The system uses a PostgreSQL database, secure storage with signed URLs, Row-Level Security (RLS), and serverless edge functions for AI processing.

CONCLUSION

ResolGate provides a secure file management solution with admin approval and AI-based content moderation. All uploaded files are reviewed before publication, reducing the risk of harmful or inappropriate content. With features like folder organization, file preview, shareable links, and real-time updates, it improves usability and security. The system is suitable for institutions and organizations requiring controlled and safe file sharing.

BATCH-06

- V ABHILASH CHARY - **237R1A05Y6**
- S RAHUL - **247R5A0529**
- B BHAVITHA - **247R5A0526**
